Art Unit: 2135

## **DETAILED ACTION**

1. Claims 40-53 have been examined.

## Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 40-53 are rejected under 35 U.S.C. 103(a) as being unpatentable over Joye et al. [Ref U] (hereinafter refereed to as Joye) (UCL Crypto Group Technical Report Series, Further results on Chinese Remaindering, March 7, 1997).
- 4. As per claim 40, Joye teaches a method of determining a secret information in a cryptography device, the method comprising:

generating an electrical signal comprising a stream of bits (messages M1, M2) containing a correct digital signature in a cryptography device (page 2, paragraph 3, lines 1-2);

placing the cryptography device under physical stress (damaging the device) and in response to the physical stress, generating an electrical signal comprising a stream of

Art Unit: 2135

bits containing an incorrect digital signature in the cryptography device (page 2, paragraph 3, lines 3-4);

determining secret information q stored in said cryptography device using:

gcd (E-E', N) = q, [page 2, paragraph 3, line 5, and page 3, preposition 1]

generating an output electrical signal comprising a stream of bits containing the secret information used to generate the correct signature (page 3, preposition 1, last line).

Joye does not explicitly teach utilizing two different devices to generate the secret information. It would have been obvious to one having ordinary skill in the art at the time the invention was made to implement a method of using two devices to generate a secret information into the secret generation method of Joye so that the secret can be generated using two devices.

- 5. As per claim 41, Joye teaches a method of determining secret information in a cryptography device as applied to claim 40 above. Furthermore, Joye teaches the method, wherein the device generates a digital signature which may be separated in to linear components (i.e. signatures s1, and s2) [page 2, paragraph 3, lines 1-2].
- 6. As per claim 42, Joye teaches a method of determining secret information in a cryptography device as applied to claim 40 above. Furthermore, Joye teaches the method, wherein placing the said first cryptography device under physical stress

Art Unit: 2135

includes at least one of applying atypical voltage levels, applying a higher speed, or applying radiation (i.e. damaging the device) [page 2, paragraph 3, line 3].

7. As per claim 43 Joye teaches a method of determining a secret information in a cryptography device, the method comprising:

in a cryptography device, generating an electrical signal comprising a stream of bits containing a first authentication value of form r^2 mod N wherein r is a random number and N is a secret value which is a product of prime numbers (page 2, paragraph 2, lines 1-2, and paragraph 3, lines 1-2);

in a cryptography device, generating an electrical signal comprising a stream of bits containing a subset of integers S (page 2, paragraph 3, lines 1-2);

in a cryptography device, generating an electrical signal comprising a second erroneous authentication value device (page 2, paragraph 3, lines 3-4);

determining secret information based on calculated values (page 2, General model, and page 3, preposition 1).

Joye does not explicitly teach utilizing two different devices to generate the secret information. It would have been obvious to one having ordinary skill in the art at the time the invention was made to implement a method of using two devices to generate a secret information into the secret generation method of Joye so that the secret can be generated using two devices.

Application/Control Number: 09/516,910 Page 5

Art Unit: 2135

8. As per claims 44-48, Joye teaches a method of determining secret information in a cryptography device as applied to claim 43 above. Furthermore, Joye teaches the method wherein generating the secret value involves calculated values based on two prime numbers p and q and module n being the product of the two prime numbers (page 2, General model, and page 3, preposition 1); and generating a plurality of signatures comprising a subset of integers S (page 2, paragraph 3, lines 1-2);

9. As per claims 49-53, the claimed steps correspond to the functions of the elements of the method claims 44-49, which has been rejected above and thus rejected with the same reason applied thereto.

## Conclusion

- 10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
- a) U.S. Patent No. 5,991,415 to Shamir teaches a method and apparatus for protecting public key schemes from timing and fault attacks.
- b) Eli Biham et al. Internet article teaches, How to break completely unknown cryptosystems.
- c) Floyd et al. teaches Differential falut analysis.
- d) Joye et al. teaches a method of attacks on systems using chinese remaindering.

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Beemnet W Dada whose telephone number is (703) 305-8895. The examiner can normally be reached on Monday - Friday (8:30 am - 6:00 pm).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kim Y Vu can be reached on (703) 305-4393. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
